**SIRT6 Stained Tissue Microarray**

**Supplementary Figure S1: Tissue microarray (TMA) staining and organization.** A) Diagram of the TMA indicating location and tissue type of each core. B) Whole image of the SIRT6-stained slide with hematoxylin counterstaining. ME1004c indicates the catalog number from US Biomax, Inc that was used for the study.

**Supplementary Figure S2: Multiple SIRT6-targeting shRNA constructs were analyzed for SIRT6 knockdown.** (A) A375 melanoma cells were transfected using Lipofectamine 2000 using manufacturer's protocol (using 4  $\mu$ g of DNA and 10  $\mu$ l of Lipofectamine reagent per well in six well plate) with nonsense (NS) and five SIRT6-targeting shRNA for 48 h, and cells were analyzed 48 h later. Cell lysates were subjected to SDS-PAGE and western blotting for SIRT6 protein as in Materials and Methods. Equal loading was confirmed by reprobing the blot for  $\beta$ -tubulin. Further, the two best constructs were chosen to determine which had the best knockdown via lentiviral transduction. (B) A375 cells were transduced with nonsense (NS) and the two best SIRT6 knockdown constructs from A, -73 and -76, for 48 h and collected 48 h later. Cell lysates were subjected to western blot and RT-qPCR to confirm SIRT6 knockdown.  $\beta$ -tubulin and GAPDH were used as controls, respectively.
